INSTRUCTION AND MAINTENANCE MANUAL:
FPR SERIES PUMP

SANITARY CENTRIFUGAL PUMP
DESCRIPTION

This manual contains installation, operation, assembly, disassembly and repair instructions for the Fristam FPR centrifugal pump.

The motors are standard NEMA totally enclosed fan cooled (TEFC) motors. They are C-face and have a locked front bearing. These motors do require feet. Replacements motors are easily available from local motor distributors.

CAUTION

Begin all pump maintenance operations by disconnecting the energy source to the pump. Observe all lock out/tag out procedures as outlines by ANSI Z244.1-1982 and OSHA 1910.147 to prevent accidental start-up and injury.

**TECHNICAL INFORMATION**

**SPECIFICATIONS**
- **Maximum Inlet Pressure**: 150 PSI
- **Temperature Range**: -40°F – 400°F
- **Noise Level**: 60 – 85 dB (A)

**STANDARD MATERIALS OF CONSTRUCTION (NOTE: OTHER OPTIONS AVAILABLE)**
- **Product Contact Components**: AISI 316L Stainless Steel
- **Seal Components**
  - Single Rotating Seal: Chrome Oxide coated 316L Stainless Steel
  - Stationary Seal: Carbon
  - Double Rotating Seal (if installed): Ceramic
- **Product Contact Surface Finish**: 32 in Ra
- **Flange Support**: Cast Iron
- **Gaskets / O-rings**: Viton
- **Cover O-ring**: Buna
- **Motor**: NEMA TEFC C-face (Painted Rolled Steel or Painted Cast Iron, 3 Phase, 60 Hz, 208-230/460 VAC, 1750/3500 RPM)

**FRONT PULL-OUT SEAL OPTIONS**
- Single Internal Mechanical
- Single Internal Mechanical with Cascade
- Single Internal Mechanical with Double External Mechanical
  - **Recommended Seal Flush Pressure**: 5 PSI Maximum
  - **Recommended Seal Flush Flow**: 1 – 2 Gallons per Hour

**SEAL SIZES**
- **757**: Used on Models: 700, 710, 720, 3520, 731, 3530, 740, 1740 & 3540
  - **Motor Frame Range**: 140TC – 320TC
  - **Single Flange**
- **758**: Used on Models: 3450, 3550, 1051 & 1161
  - **Motor Frame Range**: 180TC – 360TC
  - **Double Flange**
- **102**: Used on Model 4000

**RECOMMENDED TORQUE VALUES**
- **Impeller Nut**: Models 700-355: 40 ft-lbs
- **Impeller Nut**: Models 1050-4000: 90 ft-lbs
- **757 Housing Clamp Bolt**: 55 ft-lbs
- **758 Housing Bolts**: 50 ft-lbs
- **Motor Bolts**
  - 56C – 140TC: 20 ft-lbs
  - 180TC – 280TC: 55 ft-lbs
  - 320TC – 360TC: 110 ft-lbs
- **Shaft Collar Screw(s)**
  - 56C – 140TC: 6 ft-lbs
  - 180TC – 280TC: 15 ft-lbs
  - 280TC – 360TC: 40 ft-lbs
- **Cover Nut: Model 4000**: 105 ft-lbs
**Impeller Gaps (To Housing/To Cover)**

- **Torque wrench** .......................................................... For proper tightening
- **Adjustable pliers** .................................................. For removing water pipes
- **Soft-faced hammer** .................................................. For removing cover star nuts
- **3/8" diameter rod** .................................................. For holding the shaft when tightening & loosening the impeller
- **Food grade lubricant** ................................................. For lubricating o-rings and gaskets

**Recommended Preventive Maintenance**

**Recommended Seal Maintenance**

Visually inspect mechanical seal daily for leakage.

Replace mechanical seal annually under normal duty.

Replace mechanical seal as often as required under heavy duty.

**Elastomer Inspection**

Inspect all elastomers when performing pump maintenance. We recommend replacing elastomers (o-rings and gaskets) during seal, pump shaft and/or motor replacement.

FOR DOUBLE SEAL PUMPS
**SEAL REPLACEMENT**

**DISASSEMBLY (ALL MODELS EXCEPT 4000)**

---

*Note: When replacing ANY seal part, it is important that ALL seal wear parts are replaced to ensure seal integrity.*

**Figure 1**

Remove flange guard.

Remove cover star nuts with soft-faced hammer.

Remove cover and discard cover o-ring.

---

**Figure 2**

Place 3/8” rod or Phillips screwdriver in shaft hole. Use 15/16” socket with ratchet to remove impeller nut. Discard impeller nut gasket.

Remove impeller and discard impeller o-ring.

Remove key.
Figure 3

Remove seal driver/rotating seal assembly.
Discard rotating seal, o-rings and spring.
Remove stationary seal and discard.
Double Seal Only: Remove double rotating seal and double spring and discard.
(Note: to distinguish between the seal springs: single seal spring overlaps and double seal spring has a gap.—see left)

Assembly (All Models except 4000)

Double Seal Only:

Figure 4

Install spring behind shaft pins. Place o-ring into double rotating seal and lubricate. Push seal onto shaft making sure slots align with pins.
(Note: housing and flange removed from picture for clarity)
Figure 5

Single Seal:
Install single stationary seal o-ring and lubricate.

Double Seal:
Install single and double stationary seal o-rings and lubricate.

Figure 6

Install the stationary seal into housing making sure to align flats on the seal with the flats on the housing.

Figure 7

Install spring behind seal pins inside the seal driver.
Figure 8

Install single rotating seal o-ring and lubricate. Slide seal driver onto rotating seal making sure to align pins inside the driver with the slots on the seal.

Figure 9

Slide inner seal driver o-ring onto the shaft and lubricate.

(Note: housing and flange removed from picture for clarity)

Figure 10

Slide seal driver assembly onto the shaft.

(Note: housing and flange removed from picture for clarity)
Install impeller key and outer seal driver o-ring. Lubricate o-ring.

Slide impeller onto shaft making sure to align keyway in impeller with key in the shaft.

Lubricate impeller nut gasket and place it onto the impeller nut.

Thread impeller nut onto shaft. Place 3/8” rod or Phillips screwdriver in shaft hole. Use 15/16” socket with torque wrench and torque nut to 40 ft-lbs.
**Figure 13**

Install cover o-ring.

**Figure 14**

Install cover.

Install cover star nuts and tighten with a soft-faced hammer.
**SEAL REPLACEMENT — MODEL 4000**

Begin all pump maintenance by disconnecting the energy source to the pump. Observe all lock out/tag out procedures as outlined by ANSI Z244.1-1982 and OSHA 1910.147 to prevent accidental start-up and injury.

*Note: When replacing ANY seal part, it is important that ALL seal wear parts are replaced to ensure seal integrity.*

**TOOLS FOR SEAL REPLACEMENT**

- Socket wrench
- 24mm socket
- 1 1/4" socket
- Rachet
- Pliers (channel locks)
- One soft-faced hammer
- One 5/16" diameter rod
- Optional: One pair impeller pullers (tack pullers)

**PUMP HEAD DISASSEMBLY**

Note: the reference numbers listed in the text (#) refer to the pump assembly drawing on pages 14-15.

Disconnect the suction and discharge pipe from the pump. Drain all fluid from the pump prior to disassembly.

a) Remove the cover nuts (25) with the 24mm socket.

b) Remove the pump cover (24) and the cover gasket (21).

c) Remove the guard nuts (3) and remove shaft guards (4).

d) Place a 5/16" diameter rod in a hole in the shaft (7). Hold the rod to keep the shaft from rotating while loosening the impeller nut (23) with the 1 ¼" socket wrench (Figure 4K-1).

e) Remove the impeller nut and impeller nut gasket (25).

f) Remove the impeller (22) from the pump shaft (7) by grasping an impeller blade in each hand and pulling the impeller toward you.

g) After the impeller is removed, place it on a clean flat surface with the blades facing down. The rotating seal is located in hub of the impeller. Remove and discard the rotating seal (33), o-ring (41) and spring (34).

h) Next remove and discard the stationary seal (19) by pushing on back of seal and sliding it forward out of the housing.

*For Double Mechanical Seals Only* - remove the double rotating seal (15) and spring from the pump shaft and discard. The rear rotating seal can also be pulled forward from the back of the pump housing.

Pump Head Assembly (FPR 4000 Model)– (See Seal Assembly Drawing - Pages 8-9)
NOTE: when installing the new seal components make sure that you use all of the components supplied with the replacement seal kit. Using some of the old components may reduce seal life. Lubricate all o-rings with a food grade lubricant, unless otherwise specified in the manual.

For Double Mechanical Seals Only
1) Generously lubricate the double seal o-ring (14) (unless the o-ring material is EPDM, then only water should be used for lubrication) and install on the double rotating seal (15).

2) Install the double seal spring (42) into the back of the double rotating seal.

3) Slide the double rotating seal on the pump shaft. Note: Align the grooves in the rotating seal with the pins in the pump shaft. If the seal is installed properly, it will not rotate.

4) Generously lubricate both stationary seal o-rings (18) (unless the o-ring material is EPDM, then only water should be used for lubrication) and install. Improper fit may cause leakage or seal damage.

5) Slide the stationary seal (19) onto the pump shaft. Align the flat ends of the stationary seal with the flat edges of the housing (Figure 4K-2).

6) Lubricate the rotating seal o-ring (41) with a food grade lubricant (unless the o-ring material is EPDM, then only water should be used for lubrication). Install the rotating seal o-ring onto the rotating seal (33).

7) With the impeller, blades on a clean surface, place the single seal spring (34) into the hub of the impeller.

8) Next install the rotating seal into the hub of the impeller (Figure 4K-3). Note: Align the pins in the hub of the impeller with the grooves of the rotating seal. If the seal is installed properly, it will not rotate.
9) Now you are ready to install the impeller. First align the shaft key slot on the impeller with the shaft key on the pump shaft. Now carefully install the impeller, making sure that the rotating seal doesn't make contact with the pumps shaft. If contact does occur, the rotating seal may be damaged.

10) Lubricate the new impeller nut o-ring (25) with a food grade lubricant (if it is not EPDM) and place it onto the impeller nut (23).

11) Thread the impeller nut with the o-ring in place onto the pump shaft (7). Place a 5/16" diameter rod in a hole in the shaft (7). Hold the rod to keep the shaft from rotating while tightening the impeller nut with the 1 3/4" socket wrench (Figure 4K-4). Check for the proper torque on page 4.

12) Now install the new cover o-ring (21) onto the pump cover (24) and install them onto the front of the pump. (Note: the pump serial number is embossed into the ‘top’ of the pump cover.) When placing the cover o-ring into the pump cover, gently stretch the o-ring into position. Do not roll the gasket into position.

13) Thread the cover nuts (26) onto the housing studs (238). Make sure the cover o-ring is properly seated in the cover to ensure that it will not get pinched when tightening the cover nuts. Tighten the cover nuts with a 24mm socket (see page 4 for the proper torque).

14) Now rotate the pump shaft (7) to make sure that the impeller (22) moves freely. If it does not, recheck your assembly to make sure that gaskets are not pinched and everything is seated properly. Listen to the pump as you turn the shaft. A small amount of noise from the seals is normal, but if there is metal-to-metal contact, the sound will be noticeable. If there is metal-to-metal contact, check the impeller gap. Regap the impeller if necessary. See page 18 for directions. Replace the shaft guards (4) and secure with the guard nuts (3).

Reconnect the suction and discharge piping.

WARNING: Mechanical seals must never run dry, even momentarily. Seal damage will result.
DISASSEMBLY
Disassemble pump as described in Figures 1-3

Figure 15 (models 700-354 only)
Double Seal and Water Cascade Only:
Remove water pipe(s) using adjustable pliers.
Use two 3/4” wrenches to loosen the clamping bolt and nut. Remove the housing.

Figure 16 (models 345, 355, 1051 & 1161 only)
Double Seal and Water Cascade Only: Remove water pipe(s) using adjustable pliers.
Use a 3/4” socket to remove the housing bolts and washers. Remove the housing.
Use an Allen wrench to loosen the shaft clamp cap screw(s). Remove pump shaft.

**Figure 18**

Install new shaft making sure to align the slit in the shaft with the slit in the shaft clamp. Also align the keyway in the motor shaft with the hole in the pump shaft.

(Note: flange removed for clarity)

**Figure 19 (700-354 model pumps only)**

Install housing hub into the flange. Rotate the inlet to align it with the piping.

Use a 3/4” wrench and a 3/4” torque wrench to torque the clamping bolt to 55 ft-lbs.
Install housing hub into the flange. Rotate the inlet to align it with the piping and align bolt holes.

Install the lockwashers and bolts. Use a 3/4” torque wrench to torque the bolts to 50 ft-lbs.

**Figure 19 (345, 355, 1051 & 1161 model pumps only)**

Assemble seal as described in figures 4-11.

Slide impeller onto shaft making sure to align keyway in impeller with key in the shaft.

Lubricate impeller nut gasket and place it onto the impeller nut. Thread impeller nut with gasket onto pump shaft. Use a torque wrench to torque the impeller nut to 40 ft-lbs.

Slide a feeler gauge between the impeller and housing. The thickness of feeler gauge is determined by the pump model (see page 5 for gauge thicknesses).

Set the impeller-to-housing gap (see figure 22) by pushing on the impeller. Once the feeler gauge fits snugly behind the impeller, tighten the shaft clamp bolt with an Allen wrench to the correct torque (see page 4 for torque values).

Remove feeler gauge.
Install cover o-ring, cover and cover star nuts as described in figures 13-14.
**MOTOR REPLACEMENT**

**DISASSEMBLY**
Disassemble pump as described in figures 1-3.
Remove housing and shaft as described in figures 15-17.

**Figure 22**
Use a socket to remove the motor bolts and washers. Remove the flange.

**ASSEMBLY**
Replace motor. Install flange onto motor.
Replace bolts and washers. Use a torque wrench to tighten the bolts to the correct torque (see page 4 for torque values).

Install shaft and housing as described in figures 18-20.
Assemble seal as described in figures 4-11.
Set impeller-to-housing gap as described in figure 21.
Install cover o-ring, cover and cover star nuts as described in figures 13-14.
Replace guard(s) and water pipe(s) if necessary.
INSTALLATION

UNPACKING
Check the contents and all wrapping when unpacking the pump. Inspect the pump carefully for any damage that may have occurred during shipping. Immediately report any damage to the carrier. Remove the shaft guard and rotate the pump shaft by hand to make sure the impeller rotates freely. Keep the protective caps over the pump inlet and outlet in place until you are ready to install the pump.

INSTALLING
Prior to actually installing the pump, ensure that:
• The pump will be readily accessible for maintenance, inspection and cleaning.
• Adequate ventilation is provided for motor cooling.
• The drive and motor type is suitable for the environment where it is to be operated. Pumps intended for use in hazardous environments (i.e. explosive, corrosive, etc.) must use a motor and drive with the appropriate enclosure characteristics. Failure to use an appropriate motor type may result in serious damage and/or injury.

PIPING GUIDELINES
This section describes good piping practices to obtain maximum efficiency and service life from your pump.

Maximum performance and trouble-free operation require adherence to good piping practices.
• Ensuring proper piping support and alignment at both the suction inlet and discharge outlet can help prevent serious damage to the pump housing (Figure 23).
• Avoid abrupt transitions in the piping system (Figure 24).
• Avoid throttling valves in the suction piping.
• Keep suction lines as short and direct as possible.
• Ensure that the NPSH available in the system is greater than NPSH required by the pump.
• Avoid sump areas where sediments may collect (Figure 25).
• Avoid the formation of air pockets in the piping (Figure 26).

• Avoid abrupt closure of shut-off valves, this may cause hydraulic shock which can cause severe damage to the pump and system.

• Avoid elbows in the suction line if possible. When necessary they should be located 5 pipe diameters away from the pump inlet, and have a bend radius greater than 2 pipe diameters (Figure 27).

• Check valves in discharge line should be a minimum of 5 ft. away from the pump outlet (Figure 27).

**Electrical Installation**

We use standard duty TEFC motors unless otherwise specified. Many motor options are available: washdown, flameproof, explosion proof, hostile duty or chemical duty.

The motor selected should meet the requirements of the specified operating conditions. A change in conditions (for example, higher viscosity, higher specific gravity, lower head losses) can overload the motor. When changing operating conditions or whenever there is any doubt, please contact Fristam Pumps, Inc., for technical assistance.

Have an electrician connect the motor using sound electrical practices. Provide adequate protection. Pumps fitted with mechanical seals must not run dry, not even momentarily. **Determine the direction of rotation by watching the motor fan, which must turn clockwise.**

**Pump Operations**

**Start-up Instructions**

• Remove any foreign matter that may have entered the pump.

• Do not use the pump to flush the system!

• Check pump for proper rotation as indicated on the pump. **Proper motor direction is clockwise when looking at the fan end of the motor. (NOTE: When checking the direction of rotation, the pump must be full of liquid.)**

• Never run the pump dry, even momentarily. Seal damage can result.

**Shut-down Instructions**

• Shut off the power supply to the pump.

• Close the shut-off valves in the suction and discharge piping.

• Drain and clean the pump.

• Protect the pump against dust, heat, moisture and impact damage.
Installation of Water Flush for Double Mechanical Seal

Set up the water flush for the double mechanical seal as shown (Figure 28). Use only between 1-2 gallons per hour of water at a maximum pressure of 5 PSI. Excessive flow of water through the seal increases the pressure inside the seal. Note: maximum pressure inside the seal is 5 PSI. Excessive flow/pressure through the seal flush will cause excessive wear and shorten seal life.

Pipe the exit side of the water flush with 2-5 feet physical height of tubing. This ensures that some water is always in the center seal and the seal never runs dry.

It is possible to inject steam through the center seal (within the pressure requirements). We do not recommend using steam alone for the cooling/lubricating of the seal.

It is desirable to have the flush water on the outlet side visible. This allows an easy check to see that the flush water is on and also if the seal is functioning properly. In a malfunctioning seal the flush water will disappear, become discolored, or show an unusual increase in flow. If these conditions exist, check the seal and replace if necessary.

Installation of Water Cascade

The water cascade (if supplied) is piped through the hub of the pump housing and into the stationary seal. Since there is no rear seal, the flush water will exit through the rear of the seal area (Figure 29).

Not all FPR pumps require a water cascade on the seal.

Use about 1-2 gallons per hour of water at a maximum pressure inside the seal of 5 psi.

NOTICE OF TERMS, WARRANTY PROVISIONS
INCLUDING DISCLAIMERS, CLAIMS AND LIMITATION OF LIABILITY

Prices and all terms and conditions of sale are established in current price sheets and are subject to change without notice. All orders are subject to acceptance by Fristam Pumps USA, Limited Partnership.

Each Fristam Pumps item is warranted to be free from manufacturing defects for a period of one (1) year from the date of shipment, providing it has been used as recommended and in accordance with recognized piping practice, and providing it has not been worn out due to severe service, such as encountered under extremely corrosive or abrasive conditions.

This warranty is expressly in lieu of any other warranties expressed or implied, including but not limited to, any implied warranty of merchantability or fitness for particular purpose. All other warranties whatsoever, expressed or implied by law or otherwise, are hereby excluded.

All claims must be in writing and must be mailed or delivered by purchaser within thirty (30) days after purchaser learns of the facts upon which such claim is based. Any claim not made in writing and within the time period specified above shall be deemed waived.

Purchaser’s sole and exclusive remedy and Fristam Pumps maximum liability for claims arising hereunder or for negligence for any and all losses and damages resulting from any cause shall be either the repair or replacement of defective items or, at Fristam Pumps’ option, the refund of the purchase price for such items. In no event, including in the case of a claim for negligence, shall Fristam Pumps be liable for incidental or consequential damages, including loss of profits.

No person, including any representative employee or agent of Fristam Pumps is authorized to assume on behalf of Fristam Pumps any liability or responsibility in addition to or different from that described in this provision. Any and all representations, promises, warranties or statements that are in addition to or different from the terms of this provision are of no force or effect.

If any provision of this Notice is held to be invalid, such provision shall be severed and the remaining provisions shall continue to be in force.
